

Products: Tandem 717 (Air Top 2000 & TSL 17 Combination Kit)

09-24-1999

To the Installer:

The combination of Webasto's auxiliary forced air and coolant heater makes perfect sense for "engine off" sleeper heat and engine preheat. This heating system delivers fast, continuous heat for driver comfort and powerful engine preheat for reliable starts.

The Tandem 717 kit is comprised of the Air Top 2000 and the TSL 17 heaters. The installation of both heaters must be performed in accordance with the installation instructions provided in the respective installation manuals. Do not install these heaters unless you are familiar with basic truck repair procedures and safe workshop practices.

Webasto has equipped the Tandem 717 kit with a dual fuel standpipe to accommodate fuel supply to both heaters. Please install the new standpipe according to the installation description in either manual.

Note: The new fuel standpipe will not fit existing 1/4" or 1/2" NPT fuel tank ports.
