

Recommended Semi Annual Sunroof Maintenance:

The following tips are suggested for sunroof maintenance:

Glass Panel:

The tinted glass panel is heat and UV resistant. To clean the glass panel use of a mild non scratching detergent and moist chamois is recommended. In case of moisture being present on your sunroof, it is best to wait until this moisture has dissipated to open and enjoy your roof.

Seal:

The glass panel fits against a highly resilient wear resistant rubber seal which enables it to be watertight. In order to keep this seal free from dust, dirt and debris, clean with a moist chamois. The application of calcium powder also extends the life of this seal.

Water Management System:

In order to maintain the functionality of the water management system it is necessary to keep it free of dirt and debris. On a yearly basis, one can use an air nozzle to clear the drain tubes of anything that may be inhibiting their full drainage capacity.

Mechanisms:

The moving parts of the sunroof are low-maintenance materials. After prolonged use, it may be necessary to clean these moving parts, and lubricate them with light oil.
